|---------------------|----------------------------------|
| Started on | Friday, 9 August 2024, 1:39 PM |
| State | Finished |
| Completed on | Friday, 9 August 2024, 1:51 PM |
| Time taken | 11 mins 59 secs |
| Marks | 1.00/1.00 |
| Grade | 10.00 out of 10.00 (100%) |

Question 1

Correct

Mark 1.00 out of 1.00

[Flag question](#)

Convert the following algorithm into a program and find its time complexity using the counter method.

```
void function (int n)
{
    int i = 1;
    int s = 1;

    while(s <= n)
    {
        i++;
        s += i;
    }
}
```

Note: No need of counter increment for declarations and `scanf()` and `count` variable `printf()` statements.

Input:

A positive Integer n

Output:

Print the value of the counter variable

For example:

| Input | Result |
|-------|--------|
| 9 | 12 |

Answer: (penalty regime: 0 %)

Ace editor not ready. Perhaps reload page?

Falling back to raw text area.

```
#include<stdio.h>
void function(int n)
{
    int count=0;
    int i=1;
    count++;
    int s=1;
    count++;
    while(s<=n)
    {
        count++;
        i++;
        count++;
        s+=i;
        count++;
    }
    count++;
    printf("%d",count);
}
```

| | Input | Expected | Got | |
|---|-------|----------|-----|---|
| ✓ | 9 | 12 | 12 | ✓ |
| ✓ | 4 | 9 | 9 | ✓ |

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question 1

Correct

Mark 1.00 out of 1.00

[Flag question](#)

Convert the following algorithm into a program and find its time complexity using the counter method.

```
void func(int n)
{
    if(n==1)
    {
        printf("##");
    }
    else
    {
        for(int i=1; i<=n; i++)
        {
            for(int j=1; j<=n; j++)
            {
                printf("##");
                printf("##");
                break;
            }
        }
    }
}
```

Note: No need of counter increment for declarations and scanf() and count variable printf() statements.

Input:

A positive Integer n

Output:

Print the value of the counter variable

Answer: (penalty regime: 0 %)

```
1 #include<stdio.h>
2 void func(int n)
3 {
4     int count=0;
5     if(n==1)
6     {
7         count++;
8         //printf("##");
9         count++;
10    }
11    else
12    {
13        for(int i=1;i<=n;i++)
14        {
15            count++;
16            for(int j=1;j<=n;j++)

Question 1

Correct

Mark 1.00 out of 1.00

Flag question

Convert the following algorithm into a program and find its time complexity using counter method.

```
Factor(num) {
{
    for (i = 1; i <= num; ++i)
    {
        if (num % i == 0)
        {
            printf("%d ", i);
        }
    }
}
```

Note: No need of counter increment for declarations and scanf() and counter variable printf() statement.

Input:

A positive Integer n

Output:

Print the value of the counter variable

Answer:

```
1 #include<stdio.h>
2 void factor (int num)
3 {
4     int count=0;
5     for(int i=1;i<=num;i++)
6     {
7         count++;
8         if(num%i==0)
9         {
10             //printf("%d",i);
11             count++;
12         }
13         count++;
14     }
15     count++;
16     printf("%d",count);
17 }
18 }
19
20
21 int main()
22 {
23     int num;

Mark 1.00 out of 1.00

[Flag question](#)

Convert the following algorithm into a program and find its time complexity using counter method.

```
void reverse(int n)
{
    int rev = 0, remainder;
    while (n != 0)
    {
        remainder = n % 10;
        rev = rev * 10 + remainder;
        n/= 10;

    }
    print(rev);
}
```

Note: No need of counter increment for declarations and scanf() and count variable printf() statements.

Input:

A positive Integer n

Output:

Print the value of the counter variable

Answer:

```
1 #include<stdio.h>
2 void reverse(int n)
3 {
4     int count=0;
5     int rev = 0, remainder;
6     count++;
7     count++;
8     while (n != 0)
9     {
10         count++;
11         remainder = n % 10;
12         count++;
13         rev = rev * 10 + remainder;
14         count++;
15         n/= 10;
16         count++;
17     }
18     count++;
19 //print(rev);
20 printf("%d",count);
21 }
22 int main()
23 {
24     int n;
25     scanf("%d",&n);
26     reverse(n);
27 }

Question 1

Correct

Mark 1.00 out of 1.00

[Flag question](#)

Write a program to take value V and we want to make change for V Rs, and we have infinite supply of each of the denominations in Indian currency, i.e., we have infinite supply of { 1, 2, 5, 10, 20, 50, 100, 500, 1000} valued coins/notes, what is the minimum number of coins and/or notes needed to make the change.

Input Format:

Take an integer from stdin.

Output Format:

print the integer which is change of the number.

Example Input :

64

Output:

4

Explanation:

We need a 50 Rs note and a 10 Rs note and two 2 rupee coins.

Answer: (penalty regime: 0 %)

```

1 #include<stdio.h>
2 int main(){
3     int v;
4     scanf("%d",&v);
5     int coins[]={1,2,5,10,20,50,100,500,1000};
6     int count = 0;
7     for(int i = 8; i >= 0; i--){
8         count += v / coins[i];
9         v %= coins[i];
10    }
11    printf("%d",count);
12 }
```

| Time taken | 11 mins 1 sec |
| Marks | 1.00/1.00 |
| Grade | 10.00 out of 10.00 (100%) |

Question 1

Correct

Mark 1.00 out of 1.00

[Flag question](#)

Assume you are an awesome parent and want to give your children some cookies. But, you should give each child at most one cookie.

Each child i has a greed factor $g[i]$, which is the minimum size of a cookie that the child will be content with; and each cookie j has a size $s[j]$. If $s[j] \geq g[i]$, we can assign the cookie j to the child i , and the child i will be content. Your goal is to maximize the number of your content children and output the maximum number.

Example 1:

Input:

3

1 2 3

2

1 1

Output:

1

Explanation: You have 3 children and 2 cookies. The greed factors of 3 children are 1, 2, 3.

And even though you have 2 cookies, since their size is both 1, you could only make the child whose greed factor is 1 content.

You need to output 1.

Constraints:

$1 \leq g.length \leq 3 * 10^4$

$0 \leq s.length \leq 3 * 10^4$

$1 \leq g[i], s[j] \leq 2^{31} - 1$

Answer: (penalty regime: 0 %)

```

1 #include <stdio.h>
2 #include <stdlib.h>
3
4 int compare(const void *a, const void *b) {
5     return (*(int*)a - *(int*)b);
6 }
7
8 int content_children(int g[], int s[], int n, int m) {
9     qsort(g, n, sizeof(int), compare);
10    qsort(s, m, sizeof(int), compare);
11    int i = 0, j = 0, content = 0;
12    while (i < n && j < m) {
13        if (s[j] >= g[i]) {
14            content++;
15            i++;
16            j++;
17        } else {
18            j++;
19        }
20    }
21    return content;
22 }
23
24 int main() {
25     int n, m;
26     scanf("%d", &n);
27     int g[n];
28     for (int i = 0; i < n; i++) {
29         scanf("%d", &g[i]);
30     }
31     scanf("%d", &m);
32     int s[m];
33     for (int i = 0; i < m; i++) {
34         scanf("%d", &s[i]);
35     }
36     printf("%d\n", content_children(g, s, n, m));
37     return 0;
38 }
```

| Time taken | 21 mins 39 secs |
| Marks | 1.00/1.00 |
| Grade | 10.00 out of 10.00 (100%) |

Question 1

Correct

Mark 1.00 out of 1.00

[Flag question](#)

A person needs to eat burgers. Each burger contains a count of calorie. After eating the burger, the person needs to run a distance to burn it. If he has eaten i burgers with c calories each, then he has to run at least $3^i * c$ kilometers to burn out the calories. For example, if he eats 3 burgers with the count of calorie in the order: [1, 3, 2], the kilometers he needs to run are $(3^0 * 1) + (3^1 * 3) + (3^2 * 2) = 1 + 9 + 18 = 28$. But this is not the minimum, so need to try out other orders of consumption and choose the minimum value. Determine the minimum distance he needs to run. Note: He can eat burger in any order and use an efficient sorting algorithm. Apply greedy approach to solve the problem.

Input Format

First Line contains the number of burgers
Second line contains calories of each burger which is n space-separated integers

Output Format

Print: Minimum number of kilometers needed to run to burn out the calories

Sample Input

```
3
5 10 7
```

Sample Output

```
76
```

For example:

| Test | Input | Result |
|-------------|------------|--------|
| Test Case 1 | 3 1 3 2 | 18 |

Answer: (penalty regime: 0 %)

```

1 #include<stdio.h>
2 #include<math.h>
3 int main()
4 {
5     int n;
6     scanf("%d",&n);
7     int a[n];
8     for(int i=0;i<n;i++)
9     {
10        scanf("%d",&a[i]);
11        for (int j = i + 1; j < n; j++) {
12            int t;
13            if (a[i] < a[j]) {
14                t = a[i];
15                a[i] = a[j];
16                a[j] = t;
17            }
18        }
19    }
20    int sum=0,h;
21    for(int i=0;i<n;i++)
22    {
23        h=pow(n,i);
24        sum+=h*a[i];
25    }
26    printf("%d",sum);
27 }
28 }
```

Mark 1.00 out of 1.00

[Flag question](#)

Given an array of N integer, we have to maximize the sum of $\text{arr}[i] * i$, where i is the index of the element ($i = 0, 1, 2, \dots, N$). Write an algorithm based on Greedy technique with a Complexity $O(n\log n)$.

Input Format:

First line specifies the number of elements-n

The next n lines contain the array elements.

Output Format:

Maximum Array Sum to be printed.

Sample Input:

5

2 5 3 4 0

Sample output:

40

Answer: (penalty regime: 0 %)

```

1 #include<stdio.h>
2 int main(){
3     int n;
4     scanf("%d", &n);
5     int a[n];
6     for(int i=0;i<n;i++){
7         scanf("%d",&a[i]);
8     }
9     for(int i=0;i<n;i++){
10    for(int j=i+1;j<n;j++){
11        int t;
12        if(a[i]>a[j]){
13            t=a[j];
14            a[j]=a[i];
15            a[i]=t;
16        }
17    }
18 }
19 int sum=0;
20 for(int i=0;i<n;i++){
21     sum+=a[i]*i;
22 }
23 printf("%d",sum);
24 }
25
26
27

```

| | Input | Expected | Got | |

Question 1

Correct

Mark 1.00 out of 1.00

[Flag question](#)

Given two arrays array_One[] and array_Two[] of same size N. We need to first rearrange the arrays such that the sum of the product of pairs(1 element from each) is minimum. That is SUM (A[i]* B[j]) for all i is minimum.

For example:

| Input | Result |
|-------|--------|
| 3 | 28 |
| 1 | |
| 2 | |
| 3 | |
| 4 | |
| 5 | |
| 6 | |

Answer: (penalty regime: 0 %)

```

1 #include <stdio.h>
2
3 int main() {
4     int N;
5     scanf("%d", &N);
6
7     int array_One[N];
8     int array_Two[N];
9     int temp;
10    for (int i = 0; i < N; i++) {
11        scanf("%d", &array_One[i]);
12    }
13    for (int i = 0; i < N; i++) {
14        scanf("%d", &array_Two[i]);
15    }
16    for (int i = 0; i < N - 1; i++) {
17        for (int j = i + 1; j < N; j++) {
18            if (array_One[i] > array_One[j]) {
19                temp = array_One[i];
20                array_One[i] = array_One[j];
21                array_One[j] = temp;
22            }
23        }
24    }
25    for (int i = 0; i < N - 1; i++) {
26        for (int j = i + 1; j < N; j++) {
27            if (array_Two[i] > array_Two[j]) {
28                temp = array_Two[i];
29                array_Two[i] = array_Two[j];
30                array_Two[j] = temp;
31            }
32        }
33    }
34    for (int i = 0; i < N / 2; i++) {
35        temp = array_Two[i];
36        array_Two[i] = array_Two[N - i - 1];
37        array_Two[N - i - 1] = temp;
38    }
39    int min_sum = 0;
40    for (int i = 0; i < N; i++) {
41        min_sum += array_One[i] * array_Two[i];
42    }
43    printf("%d\n", min_sum);
44
45    return 0;
46}

Question 1

Correct

Mark 1.00 out of 1.00

Flag question

Problem Statement

Given an array of 1s and 0s this has all 1s first followed by all 0s. Aim is to find the number of 0s. Write a program using Divide and Conquer to Count the number of zeroes in the given array.

Input Format

First Line Contains Integer m – Size of array

Next m lines Contains m numbers – Elements of an array

Output Format

First Line Contains Integer – Number of zeroes present in the given array.

Answer: (penalty regime: 0 %)

```

1 #include<stdio.h>
2 int main(){
3     int n;
4     scanf("%d",&n);
5     int arr[n];
6     for(int i=0;i<n;i++){
7         scanf("%d",&arr[i]);
8     }
9     int count=0;
10    for(int i=0;i<n;i++){
11        if(arr[i]==0){
12            count++;
13        }
14    }
15    printf("%d",count);

| Marks | 1.00/1.00 |
| Grade | 10.00 out of 10.00 (100%) |

Question 1

Correct

Mark 1.00 out of 1.00

[Flag question](#)

Given an array `nums` of size `n`, return *the majority element*.

The majority element is the element that appears more than $\lfloor n/2 \rfloor$ times. You may assume that the majority element always exists in the array.

Example 1:

Input: `nums = [3,2,3]`
Output: 3

Example 2:

Input: `nums = [2,2,1,1,1,2,2]`
Output: 2

Constraints:

- `n == nums.length`
- `1 <= n <= 5 * 104`
- `-231 <= nums[i] <= 231 - 1`

For example:

| Input | Result |
|---------------|--------|
| 3 | 3 |
| 3 2 3 | |
| 7 | 2 |
| 2 2 1 1 1 2 2 | |

Answer: (penalty regime: 0 %)

```

1 #include<stdio.h>
2 int findMajorityElement(int arr[], int size) {
3     int candidate = -1;
4     int count = 0;
5     for (int i = 0; i < size; i++) {
6         if (count == 0) {
7             candidate = arr[i];
8             count = 1;
9         } else if (arr[i] == candidate) {
10            count++;
11        } else {
12            count--;
13        }
14    }
15    count = 0;
16    for (int i = 0; i < size; i++) {
17        if (arr[i] == candidate) {
18            count++;
19        }
20    }
21    if (count > size / 2) {
22        return candidate;
23    } else {
24        return -1;
25    }
26 }
27 int main() {
28     int n;
29     scanf("%d",&n);
30     int arr[n];
31     for(int i=0;i<n;i++)
32         scanf("%d",&arr[i]);
33
34     int result = findMajorityElement(arr, n);
35     if (result != -1) {
36         printf("%d", result);
37     }
38
39     return 0;
40 }

Mark 1.00 out of 1.00

[Flag question](#)

Problem Statement:

Given a sorted array of integers say arr[] and a number x. Write a recursive program using divide and conquer strategy to check if there exist two elements in the array whose sum = x. If there exist such two elements then return the numbers, otherwise print as "No".

Note: Write a Divide and Conquer Solution

Input Format

First Line Contains Integer n – Size of array

Next n lines Contains n numbers – Elements of an array

Last Line Contains Integer x – Sum Value

Output Format

First Line Contains Integer – Element1

Second Line Contains Integer – Element2 (Element 1 and Elements 2 together sums to value 'x')

Answer: (penalty regime: 0 %)

```

1 #include <stdio.h>
2
3 int main() {
4     int n, x;
5
6     scanf("%d", &n);

Playing with Numbers:

Ram and Sita are playing with numbers by giving puzzles to each other. Now it was Ram's turn, so he gave Sita a positive integer 'n' and two numbers 1 and 3. He asked her to find the possible ways by which the number n can be represented using 1 and 3. Write any efficient algorithm to find the possible ways.

Example 1:
Input: 6

Output: 6

Explanation: There are 6 ways to represent the number with 1 and 3

```

1+1+1+1+1+1
3+3
1+1+1+3
1+1+3+1
1+3+1+1
3+1+1+1

```

Input Format

First Line contains the number n

Output Format

Print: The number of possible ways 'n' can be represented using 1 and 3

Sample Input

6

Sample Output

6

Answer: (penalty regime: 0 %)

```

1 #include <stdio.h>
2 long long int countway(int n) {
3     if(n==0) return 1;
4     if(n==1) return 1;
5     if(n==2) return 1;
6     if(n==3) return 2;
7
8     long long int dp[n+1];

Question 1

Correct

Mark 10.00 out of 10.00

[Flag question](#)
Playing with Chessboard:

Ram is given an $n \times n$ chessboard with each cell with a monetary value. Ram stands at the (0,0), that the position of the top left white rook. He is given a task to reach the bottom right black rook position ($n-1, n-1$) constrained that he needs to reach the position by traveling the maximum monetary path under the condition that he can only travel one step right or one step down the board. Help ram to achieve it by providing an efficient DP algorithm.

Example:
Input

```
3
1 2 4
2 3 4
8 7 1
```

Output:

```
19
```

Explanation:

Totally there will be 6 paths among that the optimal is

Optimal path value: $1+2+8+7+1=19$

Input Format

First Line contains the integer n

The next n lines contain the $n \times n$ chessboard values

Output Format

Print Maximum monetary value of the path

Answer: (penalty regime: 0 %)

```
1 #include <stdio.h>
2
3 int max_monetary_path(int n, int chessboard[n][n]) {
4     int dp[n][n];
5     dp[0][0] = chessboard[0][0];
6     for (int j = 1; j < n; j++) {
7         dp[0][j] = dp[0][j - 1] + chessboard[0][j];
8     }
9     for (int i = 1; i < n; i++) {
10         dp[i][0] = dp[i - 1][0] + chessboard[i][0];
11     }
12     for (int i = 1; i < n; i++) {
13         for (int j = 1; j < n; j++) {
14             dp[i][j] = chessboard[i][j] + (dp[i - 1][j] > dp[i][j - 1] ? dp[i - 1][j] : dp[i][j - 1]);
15         }
16     }
17     return dp[n - 1][n - 1];
18 }
19
20 int main() {
21     int n;
22     scanf("%d", &n);
23     int chessboard[n][n];
24     for (int i = 0; i < n; i++) {
25         for (int j = 0; j < n; j++) {
26             scanf("%d", &chessboard[i][j]);
27         }
28     }
29     int result = max_monetary_path(n, chessboard);
30     printf("%d\n", result);
31
32     return 0;
33 }
```

Marks 1.00/1.00

Grade **10.00** out of 10.00 (100%)

Question 1

Correct

Mark 1.00 out of 1.00

[Flag question](#)

Given two strings find the length of the common longest subsequence(need not be contiguous) between the two.

Example:

s1: ggtabe

s2: tgatasb

| | | | | | | |
|----|---|---|---|---|---|---|
| s1 | a | g | g | t | a | b |
| s2 | g | x | t | x | a | y |

The length is 4

Solving it using Dynamic Programming

For example:

| Input | Result |
|-------|--------|
| aab | 2 |
| azb | |

Answer: (penalty regime: 0 %)

```

1 #include<stdio.h>
2 #include<string.h>
3 int longest_common_subsequence(const char *s1, const char *s2) {
4     int m = strlen(s1);
5     int n = strlen(s2);
6     int dp[m + 1][n + 1];
7     for (int i = 0; i <= m; i++) {
8         for (int j = 0; j <= n; j++) {
9             if (i == 0 || j == 0) {
10                 dp[i][j] = 0;
11             } else if (s1[i - 1] == s2[j - 1]) {
12                 dp[i][j] = dp[i - 1][j - 1] + 1;
13             } else {
14                 dp[i][j] = (dp[i - 1][j] > dp[i][j - 1]) ? dp[i - 1][j] : dp[i][j - 1]; // Take the max
15             }
16         }
17     }
18     return dp[m][n];
19 }
20 int main() {
21     char s1[100], s2[100];
22     scanf("%s", s1);
23     scanf("%s", s2);
24     int result = longest_common_subsequence(s1, s2);
25     printf("%d\n", result);
26
27     return 0;
28 }
29

Question 1

Correct

Mark 1.00 out of 1.00

[Flag question](#)

Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that $A[j] - A[i] = k$, $i \neq j$.

Input Format:

First Line n - Number of elements in an array

Next n Lines - N elements in the array

k - Non - Negative Integer

Output Format:

1 - If pair exists

0 - If no pair exists

Explanation for the given Sample Testcase:

YES as $5 - 1 = 4$

So Return 1.

For example:

| Input | Result |
|-----------------|--------|
| 3 1 3 5 4 | 1 |

Answer: (penalty regime: 0 %)

```

1 #include <stdio.h>
2 int find_pair_with_difference(int arr[], int n, int k) {
3     int i = 0, j = 1;
4     while (j < n) {
5         int diff = arr[j] - arr[i];
6         if (diff == k) {
7             return 1;
8         } else if (diff < k) {
9             j++;
10        } else {
11            i++;
12            if (i == j) {
13                j++;
14            }
15        }
16    }
17    return 0;
18 }
19
20 int main() {
21     int n, k;
22     scanf("%d", &n);
23     int arr[n];
24     for (int i = 0; i < n; i++) {
25         scanf("%d", &arr[i]);
26     }
27     scanf("%d", &k);
28     int result = find_pair_with_difference(arr, n, k);
29     printf("%d\n", result);
30     return 0;
31 }
32

```
